

Quaerens CRM - Commercial System Overview

Commercial brochure-style overview of the CRM capabilities, modules, automation and business value.

Document	Audience	Version
Quaerens CRM - Commercial System Overview	Prospective buyers / partner companies	Prepared 02 May 2026

This document explains the Quaerens CRM workflow in practical, step-by-step language. It is designed for training, onboarding, quality control, and management review.

Executive Overview

The Quaerens CRM is a role-based consumer-claims workflow platform with a built-in client login portal. It moves clients from first contact through manager review, closer handling, client agreements, secure document exchange, processing, email communication, agenda follow-ups and reporting.

The system is designed for teams that need control, visibility and accountability across high-volume consumer dispute or claims workflows.

Capability	Commercial value
Role dashboards	Each department sees the work relevant to them without losing management visibility.
Pipeline controls	Leads move through lister, manager, closer and processing stages with clear decision points.
Power dialer support	Click-to-call and dialer queue workflows help teams work call lists faster.
Email automation	Branded, compliant emails are sent from controlled addresses with footers and disclaimers.
Document handling	Agreements, assessment reports and processing documents can be generated, sent, uploaded and tracked.
Client file timeline	The full client story can be viewed across departments.

Core Modules

Module	What it does
Lead Management	Stores imported or captured leads, campaign data, contact details, call attempts and lead status.
Staff/Lister Workflow	Supports calling, outcome tracking, callback booking, controlled emails and manager handoff.
Manager Review	Lets managers approve, reject, request more information and assign suitable leads to closers.
Closer Workflow	Manages appointments, deal figures, custom emails, assessment attachments, agreements and handoff to processing.
Processing Case Management	Provides case detail pages, document uploads, support emails, case health and client updates.
Agenda and Follow-Ups	Creates dated follow-ups so callbacks and future work appear on the correct day.
Client File	Combines notes, emails, documents, agreements, tasks, agenda items and processing updates in one place.
Admin and Reporting	Supports dashboards, counts, exports, claim values and operational monitoring.

Automation and Communication

- Resend-powered email sending from controlled Quaerens addresses such as clientsupport@quaerens.co.uk, support@quaerens.co.uk and admin@quaerens.co.uk.

- Branded email templates with Quaerens logo, company details and confidentiality disclaimer.
- Generated client paperwork and agreement PDFs.
- Staff-only controlled templates where body wording is locked to reduce risk.
- Closer and processing email tools for more personalised client communication.
- Email and document events recorded into client history where appropriate.

Built-In Client Login Portal

The CRM includes a client-facing login area so the business is not limited to internal notes and email chasing. Clients can be given a controlled place to interact with their case, provide information and upload documents.

Client portal feature	Business benefit
Secure client access	Clients have a dedicated route into their case journey instead of relying only on email attachments.
Document upload	Clients can upload requested evidence directly into the workflow, reducing inbox clutter and missing documents.
Case requests	Processing and support teams can ask for specific information and keep the request visible.
Agreement visibility	Clients can be guided to review, return or act on agreements and key paperwork.
Connected CRM record	Client-submitted documents and updates can feed into the internal client file and processing case.
Professional client experience	The portal makes the operation feel more established, transparent and easier for clients to use.

The client login portal turns the CRM from an internal staff tool into a joined-up client service platform.

Operational Benefits

Problem	CRM solution
Leads get lost between departments	Statuses and role-specific dashboards show where each lead sits.
Staff forget callbacks	Agenda and dated follow-ups put future work back in front of users.
Managers lack visibility	Manager dashboards, leads overview and client file history show progress and bottlenecks.
Inconsistent emails	Controlled branded templates keep communication professional and trackable.
Documents are scattered	Uploads are attached to the processing case/client file, including documents received through the client portal.
Closers hand off unclear cases	Agreement, notes, deal figures and processing handoff create a clearer operational record.

Technology Foundation

- Firebase Authentication for staff sign-in and role-controlled access.
- Firestore for live CRM records, lead assignments, processing cases, agenda items, sent emails, timeline entries and document metadata.
- Firebase Hosting for secure web delivery.
- Firebase Cloud Functions for controlled server-side email sending and automation.
- Firebase Storage for client and case document uploads.
- Resend for branded transactional emails.
- 8x8-compatible click-to-call and dialer workflow, with future scope for deeper API/contact-centre integration.

Commercial Positioning

This CRM can be positioned as a practical claims-operation platform for businesses that manage outbound lead contact, consumer dispute assessment, appointment setting, client agreements and post-sale case processing.

- Suitable for claims management-style operations, document-assistance services, dispute-resolution support businesses and regulated or semi-regulated service teams requiring careful workflow control.
- Can be adapted for different campaigns, claim types, departments, email identities and document templates.
- The platform already contains many of the building blocks usually missing from simple spreadsheet or generic CRM setups: workflow decisions, role separation, client file history, document management and branded email sending.

Example End-to-End Workflow

Stage	Department	CRM action	Result
Lead created/imported	Staff / Admin	Lead appears in the lister queue with campaign and contact data.	Lead is ready to work.
Initial call	Lister	Call outcome, notes, callback or email template recorded.	Lead has a clear first action.
Qualification	Lister	Interested/qualified lead is sent to manager.	Manager can review suitability.
Review	Manager	Approve, reject or request more information.	Only suitable leads move forward.
Appointment/closer	Closer	Client is contacted, deal figures recorded, emails/agreements sent.	Client is either converted, followed up or closed.
Processing	Processing	Case is opened, documents uploaded, support emails sent and tasks tracked.	Client file becomes the operational record.

Management Reporting and Control

- Managers can monitor lead volume, awaiting review, closer assignments, converted clients and closed outcomes.

- Admin and dashboard pages give operational visibility across free claim tools, lead flow and claim value.
- Agenda and callback reporting reduce the risk of forgotten follow-ups.
- Timeline and client file views provide an audit-style history of key actions.
- The system can support commercial decisions such as which campaigns produce qualified leads, where bottlenecks occur, and which departments need attention.

Security, Access and Compliance Features

Feature	Why it matters
Role-based login	Users only see workflows relevant to their role.
Firestore security rules	Data access can be controlled by authenticated user roles.
Controlled sender addresses	Client communication comes from approved business addresses.
Locked staff templates	Reduces inconsistent wording and protects brand/compliance tone.
Client file timeline	Creates visibility over who did what and when.
Document storage	Documents stay attached to the case rather than being scattered across inboxes.

Optional Next-Level Add-Ons

- Deeper 8x8 API integration so calls can be made and logged fully inside the CRM without separate tabs.
- Advanced manager risk dashboard with stale case alerts, missed callbacks and weak-evidence warnings.
- Automated SMS/WhatsApp reminders for appointments, client portal logins and document requests.
- Client portal where customers can upload documents, view requests and sign agreements.
- Automated document pack generation by claim type.
- Campaign profitability reporting by lead source, closer, conversion rate and processing outcome.
- AI-assisted note summarisation and next-action recommendations, subject to careful privacy controls.

Why This CRM Is Commercially Valuable

- It is not just a contact list. It is a workflow system that controls how work moves between departments.
- It combines lead handling, quality review, closer workflows, client login access, document generation, branded email, case processing and follow-up management.
- It can be adapted to multiple claims or dispute verticals without rebuilding the entire operating model.
- It gives a business owner visibility over activity, bottlenecks and client status.
- It reduces dependence on scattered spreadsheets, personal inboxes and verbal handoffs.

Commercial summary: the CRM turns a claims operation into a structured, trackable and repeatable process.
